

Use case:

- Company: **FemCare AI**
 - Company description: **Guiding women through complex health journeys.**
 - Company problems: **AI knowledge and regulations**
-
- People in the project (one persona per group):
 - Persona 1:
 - Name: Markus
 - **Role:** Product Management
 - **Background:** Experienced in health tech product lifecycle; passionate about improving user engagement through data-driven insights.
 - **Goals:** Advocate for user-centered design and develop tools that enhance dialogue between women and healthcare providers.
 - **Hidden pain point:** no experience with AI, needs it
 - Persona 2:
 - Name: Adi
 - **Role:** Revenue & Business Development
 - **Background:** Leads commercial strategy, partnerships, and go to market activities.
 - **Goals:** Scale the platform, increase market adoption, and secure strategic healthcare partnerships.
 - **Hidden Pain Point:** The product struggles to differentiate itself in a crowded digital health market, making customer acquisition expensive and uncertain.
 -
 - Persona 3:
 - **Name:** Gunter
 - **Role:** Operations
 - **Background:** Experienced healthcare operations leader responsible for organizational efficiency, budgets, and company restructuring.
 - **Goals:** Improve operational efficiency and scale the business without increasing costs.
 - **Hidden Pain Point:** Under pressure from investors to reduce operating costs. Concerned that AI initiatives may trigger employee resistance due to fears of job losses and organizational change. Often provides incomplete or distracting information because he is overwhelmed by multiple restructuring projects.

1. Menopause Companion

Concept

An AI powered digital companion designed to support women throughout the menopause transition by helping them understand symptoms, track changes, and prepare for healthcare conversations.

Problem

Many women experience menopause related symptoms without receiving adequate support, guidance, or clear information. Symptoms can be difficult to track over time and often impact quality of life, work performance, and overall wellbeing.

AI Capabilities

- Track symptoms and lifestyle factors over time
- Provide evidence based educational information
- Identify symptom patterns and trends
- Help users prepare for medical appointments
- Generate structured health summaries for healthcare providers
- Support long term health monitoring and self management

Example

A user records hot flashes, sleep disturbances, mood changes, and fatigue over several months.

The AI:

- Detects recurring patterns and triggers
- Provides personalized educational content
- Creates a structured symptom report
- Helps the user prepare questions for a healthcare professional

Important Note

The system does not diagnose medical conditions or prescribe treatments. It supports symptom tracking, patient education, and communication with healthcare providers.
